# Setup – Lingualized full dentures according to the GERBER concept

Chewing stability is a decisive factor for the success of full denture restorations. Wearers of dentures often complain of painful pressure sores, inadequate denture prosthesis retention and limited chewing function. These constraints are largely avoided with lingualized posterior tooth placement according to the GERBER concept.

## Learning objectives

- › Elaboration of the basics for the functionality of full denture restoration as well as the principle of the lingualized tooth-to-tooth relationship in static and dynamic occlusion
- › Understanding and applying the model analysis according to GERBER to implement and apply autonomous chewing stability of the posterior teeth
- › Learning and applying the design principles of papillae, tooth neck and artificial alveolar modeling as well as the »muscular-grip-ping«, myotonic denture body design

## Recommended experience

- › Advanced 3–5 years
- › Expert > 5 years

## Format

- › Presence

## Duration

2 Days

If you have any questions about our training courses or an individual in-house offer, please contact us at:

[ssop.swiss](mailto:ssop.swiss) | [hello@ssop.swiss](mailto:hello@ssop.swiss)

## Topics

1. What full dentures must perform
2. Lingualized full dentures according to GERBER
3. Static and dynamic occlusion in tooth-to-tooth relationship
4. Model analysis according to GERBER
5. Anterior tooth setup
6. Posterior tooth setup with the Condyloform II NFC<sup>+</sup>
7. Static and dynamic occlusion check
8. Wax modeling—papillae, tooth necks, and myodynamic denture body design

## For

- › Dental technicians
- › Prosthodontists
- › Clinical dental technicians

## Category

- › Basic course
